YASWANTH KUMAR R S

FULL - STACK SOFTWARE ENGINEER | MSc COMPUTER SCIENCE (UCD)

Dublin, Ireland | yaswanth.rajaramsubburam@ucdconnect.ie | GitHub | LinkedIn | +353 892410816 |

PROFESSIONAL SUMMARY:

Results-driven and quality-focused full-stack software engineer with three years of experience building Java/Spring Boot services, React applications with hands-on experience on Kubernetes, Docker and GitHub Actions. Recognised for strong technical ownership, analytical problem-solving, performance optimisation, and legacy-system modernisation, leading to promotion to Specialist Software Engineer within the same company. Currently pursuing an MSc in Computer Science at University College Dublin.

SKILLS

- **Programming Languages:** Java, JavaScript, Typescript, SQL, C++, Python (Basics)
- **Technologies & Tools:** Spring Boot, ReactJS, Spring Batch, Kubernetes, Docker, Git, GitHub Actions (CI/CD), Rest APIs, JIRA, Agile/Scrum

PROFESSIONAL EXPERIENCE

Societe Generale Global Solution Centre, Bangalore

Specialist Software Engineer - Promoted **Apr 2026 - Aug 2026**

- Led a two-month SonarQube remediation across five repositories, reducing technical debt by resolving a backlog of 3,000 code smells through pattern-based fixes and manual validation.
- Applied a quality-focused and pragmatic approach to increase code coverage from 40% to 85% across three repositories by developing reusable mocks and reference test templates, leveraging GitHub Copilot to accelerate implementation while rigorously reviewing and refining every test case.

Software Engineer **Jul 2023 - Mar 2026**

- Improved API performance by over 90% (from 3 minute to under 2 seconds) using server-side pagination and materialized views involving complex joins across 30+ tables ensuring performance-focused problem-solving.
- Achieved a 14x boost in Excel export performance by optimizing streaming and memory handling (reduced 30k record export time from ~14s to ~1s).
- Redesigned a legacy Talend-based ETL process with a Spring Batch microservice, cutting compute costs and improving large flat-file processing efficiency.
- Proactively automated Excel data grooming and bulk access imports through a custom RESTful API, reducing manual effort and associated operational costs by more than 80%.
- Strengthened delivery reliability by streamlining CI/CD workflows with GitHub Actions, enabling faster and more consistent deployments.

EDUCATION

Master of Science (MSc) in Computer Science (Negotiated Learning)
University College Dublin, Ireland
Sep 2026 - Expected Sep 2027

Bachelor of Engineering (B.E.) in Computer Science and Engineering
Anna University, MIT Campus, India
Aug 2019 - May 2023 | CGPA: 8.63/10

PROJECTS

DevMetrics — GitHub Engineering Analytics Platform **Apr 2026 - Sep 2026**

React · TypeScript · Java/Spring Boot · PostgreSQL · GitHub REST API

- Built a full-stack engineering analytics platform where users sign in with GitHub, connect repositories, and monitor pull-request, commit, review, and contributor activity.
- Integrated GitHub OAuth with HttpOnly JWT cookies, enforced repository ownership checks, and implemented soft disconnect/reconnect to preserve previously collected metrics and repository history.
- Developed a GitHub data-sync process that loads the default branch's full commit history on the first connection and later fetches only new commits, using pagination, an overlap window, and SHA checks to prevent missing or duplicate records.
- Computed and persisted 13 repository metrics, including merge time, first-review time, pull-request backlog, code churn, contributor activity, delivery velocity, and a custom repository health score.
- Built an interactive dashboard with historical trends, custom sparklines, rule-based insights, side-by-side comparison across 10 metrics, and report downloads in JSON, CSV, and Markdown.
- Leveraged AI to accelerate UI refinement, investigate GitHub sync issues, and improve project documentation.

Team Access Manager — Full-Stack Access Management System **July 2025 - Sep 2026**

React · TypeScript · Java/Spring Boot · PostgreSQL · Spring Security

- Built a full-stack access-management application with separate dashboards for platform administrators, team administrators, and users, supporting team, user, feature, and permission management.
- Designed team-based permission inheritance with per-user overrides, allowing user-specific access exceptions without changing permissions for the rest of the team.
- Implemented the complete feature grant/revoke request lifecycle, including request cancellation, team-level reviewer authorization, approval or rejection, permission updates, and audit history.
- Developed secure account onboarding and password recovery using emailed temporary credentials, JWT authentication, BCrypt password hashing, and six-digit OTPs with expiry, resend cooldowns, attempt limits, and single-use reset tokens.
- Implemented safe team deactivation by converting affected inherited users to zero-access overrides while preserving user accounts and audit history.
- Leveraged AI to refine role-based user flows, evaluate permission and authentication edge cases, and improve project documentation.

ADDITIONAL INFORMATION

- **Certifications:** Received certification in "Generative AI for Everyone" from DeepLearning.AI via Coursera
- **Awards:**
  Star of the Quarter – Recognized for excellence in technical skills and project contributions.
  Spot Award – Streamlined workflows by mapping JIRA dependencies, improving efficiency.
  Spot Award – Optimized database costs and authored runbook reducing onboarding from weeks to days.
